PART I

INTRODUCTION AND OBJECTIVES OF THE SURVEY

I. Introduction

Agriculture is the major contributor to the Ethiopian economy. A great majority of the Ethiopian population are engaged in agriculture to earn their livelihood and most of the nation's exports are made up of agricultural produce. The collection of reliable, comprehensive and timely data on agriculture is thus essential for policy formulation, decision making and other uses. In this regard the Central Statistical Authority (CSA) has exerted effort to provide users and policy makers with reliable and timely agricultural data.

This report presents one of the series of the 1998/99 (1991 E.C) Agricultural Sample Survey (AgSS) results, i.e. area and production for the major crops produced within the private peasant holdings sector of the economy. The report consists of three parts where Part I includes the objectives of this annual survey, Part II includes coverage and content of the survey, sample design, field organization, training of field staff, method of data collection and Part III includes survey estimates of area, production and yield of major crops. Estimation procedures and formulations for estimates of totals, ratios, and variance are presented in Appendix I.

Estimates of the standard errors with the corresponding coefficient of variations for area and production of the major crops are presented in

appendix II, the number of agricultural households covered, parcels and fields measured, and number of crop cuttings completed are presented in Appendix III and the survey questionnaires in Appendix IV.

2. Objectives of the survey

The general objective of CSA's Agricultural Sample Survey (AgSS) is to collect basic quantitative information on the country's agriculture that is considered essential for development planning, socio-economic policy formulation, food assistance, etc. The AgSS is composed of four components: crop production forecast survey, Meher season survey, livestock survey, and survey of the Belg season crop area and production.

The specific objectives of the Meher season area and production survey are to estimate the total cultivated land area, production and yield per hectare of major crops (temporary). Companion reports are published separately with estimates of land use and quantity of agricultural inputs applied by type for the Meher and Belg seasons. All reports are based on the private peasant holdings in sedentary areas of the nation, further subdivided by regions and zones.

PART II

SURVEY METHODOLOGY, DATA COLLECTION AND PROCESSING

1. Scope, Coverage and Content of the Survey

The 1998/99 (1991 E.C) annual Agricultural Sample Survey used a sampling frame which was designed to cover the sedentary rural agricultural population in all regions of the country (urban and nomadic areas were not included in the survey). Illustrated in Table A is a break down of the sample distribution as expressed by regions, zones and weredas. A total of 56 zones and 417 weredas were actually covered by the survey.

The area sampling unit used for this survey is defined as an enumeration area (EA) as defined for the 1994 Population and Housing Census. For the 1998/99 AgSS a total of 1450 enumeration areas were selected from all regions of the country. Due to various reasons, 22 EAs were not covered in the survey which resulted in the survey actually covering 1428 enumeration areas (EAs). From each of the selected EAs a representative sample of forty agricultural households were selected to represent the agricultural population of the sampled EA.

Of these forty agricultural households, the first twenty-five were used for obtaining information on area under crops, Meher and Belg season production of crops, land use, agricultural practices, crop damage, and quantity of agricultural inputs used. It is important to note that of the total forty agricultural households sampled in each of the selected EAs, data on crop

cutting were collected for only the fifteen households (11th-25th households selected).

TABLE A: AREA COVERAGE OF THE 1998/99 AGRICULTURAL SAMPLE SURVEY

REGION	NUMBER OF ZONES			NUMBER OF WEREDAS		
	TOTAL	COVERED	NOT COVERED	TOTAL ³	COVERED	NOT COVERED
TIGRAY ¹	5	4	1	33	33	-
AFAR ²	5	3	2	8	7	1
AMHARA ¹	11	10	1	93	93	-
OROMIYA	12	12	-	171	171	-
SOMALIE ²	9	3	6	9	9	-
BENISHANGUL-GUMUZ	3	3	-	18	18	-
SNNP	14	14	-	73	73	-
GAMBELA	4	3	1	5	5	-
HARARI	1	1	-	1	1	-
ADDIS ABABA ¹	6	2	4	5	5	-
DIRE DAWA	1	1	-	1	1	-
TOTAL	71	56	15	417	416	1

Note

1= Zones that are not covered in these regions are urban.

2 = Zones that are not covered in these regions are the ones that are not inhabited by significant number of sedentary population.

3 = Numbers of total weredas signify those weredas in covered zones of the respective regions.

SNNP = Southern Nations, Nationalities and Peoples.

2. Concepts and Definitions

In order to collect standardized data of acceptable quality the same concepts and definitions must be used by all field enumerators during data collection. Below are defined some of the more important concepts and definitions used for the survey.

Enumeration Area (EA): an enumeration area in the rural parts of the country is a locality that is less than or equal to a farmers' association in geographical area and usually consists of 150-200 households.

Household: a household may be either,

a) a one person household, that is a person who makes provisions for his own living without combining with any other person to form part of a multi-person household or

b) a multi-person household, that is, a group of two or more persons who live together and make common provisions for food and other essentials of living. The persons in the group may pool their incomes and have a common budget to greater or lesser extent. They may be related or unrelated persons, or a combination of both. These persons are taken as members of the household.

Agricultural household: a household is considered an agricultural household when at least one member of the household is engaged in growing crops and/or breeding and raising livestock in private or in combination with others.

Holder: a holder is a person who exercises management control over the operations of the agricultural holding and makes the major decision regarding the utilization of the available resources. He has primary technical and economic responsibility for the holding. He may operate the holding directly as an owner or as a manager. Under conditions of traditional agricultural holding the holder may be regarded as the

person, who with or without the help of others, operates land and/or raises livestock in his own right, i.e. the person who decides on what, which, where and how to grow crops or raise livestock and has the right to determine the utilization of the products.

Holding: a holding is all the land and/or livestock kept which is used wholly or partly for agricultural production and is operated as one legal entity by one person alone, or with others without regard to management, organization, size or location

Parcel: a parcel of holding is any piece of land entirely surrounded by land and/or water and/or road and/or forest ... etc. which is not part of the holding. It may consist of one or more cadastral units, plots or fields adjacent to each other.

Field: a field is defined as any plot of land which is a parcel or part of a parcel under the same or mixed crops or any other form of private land holding.

Meher (main) season crop: any crop harvested from Meskerem (September) to Yekatit (February) is considered as Meher season crop.

Belg Season Crop: any crop harvested during the months of Megabit (March) to Nehase (August).

Temporary crops : temporary crops are crops which are grown under a cycle of less than one year, sometimes only a few months with an objective to be sown or replanted again for additional production following the current harvest. Continuously grown crops planted in rotation are also considered temporary crops since each is harvested and destroyed by ploughing in preparation for each successive crop.

Permanent Crops: crops which are grown and occupy land for a long period of time, not requiring replanting for several years after each harvest, are considered permanent crops. All fruit trees (i.e. oranges, mandarins, banana, etc) and trees for beverages (i.e. coffee, tea, etc.) are considered permanent crops, but meadows and pastures are excluded.

5. Sample Design

The 1998/99 (1991 E.C.) meher season agricultural survey covered the rural part of the country except two zones in Afar region and six zones in Somalie region that are predominantly nomadic. A two-stage stratified sample design was used to select the sample EAs and the agricultural households. Each zone/special wereda in the sampled population of Tigray, Afar, Amhara, Oromiya, Somalie, Benishangul-Gumuz, SNNP regions was adopted as stratum for which major findings of the survey are reported. But each of the four regions, namely; Gambela, Harari, Addis Ababa and Dire Dawa were considered as reporting levels. The primary sampling units (PSUs) were

enumeration areas (EAs) and agricultural households were the secondary sampling units.

The survey questionnaires were administered to all agricultural holders within the sample households. A fixed number of sample EAs was determined for each stratum/reporting level based on precision of major estimates and cost considerations. Within each stratum EAs were selected using probability proportional to size; size being total number of households in the EAs as obtained from the 1994 population and housing census. From each sample EA, 25 agricultural households were systematically selected for the meher season survey from a fresh list of households prepared at the beginning of the fieldwork of the survey.

A total of 1,450 EAs (2.9 % of total EAs in the rural areas of the country) were selected for the survey. However, 22 EAs were not covered by the survey due to various reasons that are beyond the control of the Authority. Thus, the survey succeeded in covering 1428 (98.48 %) EAs. With respect to ultimate sampling units, it was planned to cover a total of 36,250 agricultural households for area measurement and 21,750 agricultural households for crop cutting (see appendix III). The response rate was found to be 98.94 % for area measurement and 95.50 % for crop cutting. Distribution of the number of sampling units sampled and covered by strata is given in appendix I. Estimation procedures of parameters of interest (total and ratio) and their sampling error is presented in appendix II. In appendix III, distribution of EAs

sampled and covered, agricultural households sampled and actually covered, fields measured and crop cuttings is presented.

4. Field Organization

All the 22 Branch Statistical Offices of the CSA participated in the survey undertaking, especially in organizing the second stage training, in deploying the field staff to their respective sites of assignment, and retrieving completed questionnaires and submitting them to the head office for data processing. The Branch Statistical Offices were also responsible in administering the financial and logistics aspect of the survey within the areas of their assignment. In the data collection of the survey, a total of 1559 enumerators and 331 field supervisors were involved with an average supervisor-enumerator ratio of 1-to-5. To accomplish the data collection operation, all the enumerators were supplied with the necessary survey equipment (compass, protractor, ruler, measuring tape, balance scale, poles, ropes, sample bags, ... etc. at the completion of the AgSS training. To assist the data collection activities in deployment, supervision and retrieval of completed questionnaires, a total of 123 four-wheel vehicles were used. The following table shows distribution of the field staff and vehicles by Branch Statistical Office.

**Table B. Distribution of Field Staff and Vehicles by
Branch Statistical Office**

Total	1559	331	123

5. Training of Field Staff

The field staff training program was carried out in two stages. The first stage consisted of training of staff from the head office, Branch Statistical Office heads and the senior field supervisors. This training was given for a period of one week at CSA's headquarters in Addis Ababa. Many of these Personnel trained in the first stage were assigned to conduct similar training for field supervisors and enumerators for fifteen days in all the twenty-two CSA branch offices which are distributed all over the country. During this second stage of training, the field staff were given detailed classroom instruction on the objectives and uses of the AgSS, concepts and definition of terms used, the method of area measurement, method of crop cutting, correct interviewing procedures, etc. The training of the enumerators and supervisors also included field practice to reinforce the understanding of the concepts, definitions and theories discussed in the classroom with regard to field measurement and crop cutting methods.

6. Method of Data Collection

In the 1998/99 AgSS data on area and production were recorded on questionnaires using both subjective and objective enumeration methods. Information on agricultural practices (application of fertilizer, pesticides, use of improved seeds and irrigation) were collected subjectively by interviewing the holders in each sampled household.

The objective measurement procedures for area measurement were carried out for the twenty-five selected households from each sampled EA. This required

that all separate fields by land area utilization be physically measured using compass and measuring tape. In addition, for all fields under temporary crops of each holder of the last fifteen sampled households, each was classified by type of crop and for selected major crops a field was randomly selected for each crop for crop cutting to be performed. Crop cutting procedures consist of demarcation of a sixteen square meter plot randomly located in the selected field for which the crop in the field is to be harvested.

Following the field enumerator's harvest of the crop cutting plot and threshing, the crop is stored in bags with identification information (i.e. name of the crop, holder's number, parcel and field number). The crop placed in the bag is weighed immediately (green weight) after threshing, and weighed again after two weeks of drying to simulate normal holder harvesting and drying practices. The green and dry weights are recorded on the respective forms.

7. Data Processing

7.1. Editing, Coding and Verification

In order to insure the quality of the collected survey data an editing, coding and verification instruction manual was prepared and printed. Then 50 editors-coders and 10 verifiers were trained for two days in the editing, coding and verification operation using the aforementioned manual as a reference and teaching aid.

The completed questionnaires were edited, coded and later verified on a 100% basis before the questionnaires were passed over to the data entry unit. The editing, coding and verification exercise of all questionnaires was completed in about 40 days.

7.2. Data Entry, Cleaning and Tabulation

Before starting data entry, professional staff of Agricultural Statistics Department prepared edit specifications for use on personal computers utilizing the Integrated Microcomputer Processing System (IMPS) software for data consistency checking purposes.

The data on the coded questionnaires were then entered into personal computers using IMPS software. The data were then checked and cleaned using the edit specifications prepared earlier for this purpose. The data entry operation involved about 50 data encoders and it took 35 days to complete the job. Finally, tabulation was done on personal computers to produce results as indicated in the tabulation plan.

PART III

SUMMARY OF THE SURVEY RESULTS

1. Area and Production

The results for area, production and yield of major crops (temporary or annual) are presented in this publication. The estimates for the twenty major crops exclude cash crops (coffee, chat, etc), fruits, vegetables, Enset, and other root crops. Consequently, the total area under major temporary crops is estimated to be a little more than 8 million hectares (see Table C) at country level for the Meher season of 1998/99 (1991 E.C).

Out of the total crop area, cereals accounted for about 6.7 million hectares (84%), while pulses and other crops (nueg, linseed, rapeseed, ground nuts, sunflower, sesame and fenugreek) accounted for about 0.9 million hectares (11%) and 0.4 million hectares (5%), respectively. Looking at specific crops, the largest area, or about 2.1 million hectares, is reported for teff followed by maize and sorghum. For details refer to Table 1.

Table C Summary Estimates of Area, Production and Yield of Major Crops for the Year 1998/99 (1991 E.C)

Crop type	Area in million hectares		Production in million quintals		Yield qt / hectare
	number	percent	number	percent	
Cereals	6.74	84	76.83	90	11.39
Pulses	0.88	11	7.32	8	8.36
Other crops	0.40	5	1.69	2	4.26
Total	8.02	100	85.84	100	10.71

Vetch	95.05	1.19	786.24	.92	8.27
Others	396.22	4.94	1,688.74	1.97	4.26
Neug	221.11	2.76	845.30	.98	3.82
Linseed	90.44	1.13	352.78	.41	3.90
Rapeseed	10.42	.13	84.17	.10	8.08
Ground Nuts	15.03	.19	83.52	.10	5.56
Sunflower	5.58	.07	24.86	.03	4.46
Sesame	32.20	.40	176.77	.21	5.49
Fenugreek	21.43	.27	121.34	.14	5.66
All Crops	8,016.31	100.00	85,838.42	100.00	10.71

The total production estimate at country level is about 85.84 million quintals, of which cereals accounted for 76.83 million quintals, pulses accounted for about 7.32 million quintals, and other crops (mentioned above) totalled to 1.69 million quintals (see Table C).

The survey results also indicate that the yield of cereals was 11.39 quintals per hectare, the yield of pulses was 8.36 quintals per hectare and the yield of other crops (mentioned above) was 4.26 quintals per hectare. In Table 1 it is also shown that the highest yield is reported for maize, which was 18.55 quintals per hectare, and the lowest is for nugg at 3.82 quintals per hectare.

As presented in Table 2, total area cultivated and total production have increased by 17.03%, and 16.59%, respectively and the average yield per hectare has decreased by 0.37% compared to last crop season, i.e. 1997/98.

The 1998/99 AgSS design increased the number of sampling units in some of the reporting levels in order to come up with relatively more reliable survey estimates at the regional and zonal levels. Comparing the AgSS estimates at the regional level the data in Table 3 illustrates the variation in yield of Ethiopian agriculture.

In Tigray Region, 580.21 thousand hectares of land has been allotted to grow the twenty major crops by private peasant holders in 1998/99, an increase of 12.94% from the previous year. Production of the twenty major crops was up

Table 2. Estimates of 1997/98 and 1998/99 Area, Production and Yield of Major Crops for Private Peasant Holdings in Ethiopia (Meher Season)

ALL CROPS	6,849.50	8,016.31	17.03	73,626.71	85,838.42	16.59	10.75	10.71	-0.37

by 41.98% compared to 1997/98. The 1998/99 estimate of total major crop production of Tigray Region accounted for 7.61% of the total national crop production. The land area under the twenty major crops constitutes 7.24% of the total land area under similar crops at country level.

In Afar Region 15.22 thousand hectares of land was cultivated in order to grow the twenty major crops by private peasant holders in 1998/99. The area cultivated showed a decrease of 3.30% from the previous year. Production of the twenty major crops was up by 60.31% compared to 1997/98 and accounted for only 0.21% of the total crop production at country level.

Amhara Region is the second largest both in area planted and production in 1998/99 with 2.98 million hectares of land cultivated for growing the twenty major crops by private holders. This indicates an increase of 21.48% from the previous year. This area accounted for 37.24% of the national total area planted. Production of the twenty major crops was up by 30.95% from the 1997/98 and this production accounted for 33.24% of the crop production at country level.

Oromiya Region is the largest in both area planted and production in 1998/99 and 3.53 million hectares of land was cultivated to grow the twenty major crops by private holders. This shows an increase of 13.97% from the previous year. This area comprised 44.03% of the total crop area at country level and accounted for 47.89% of the total crop production, at country level. The

production in Oromiya of the twenty major crops was up by 9.03% compared to 1997/98.

Somalie and Gambella Regions both showed a decrease of 10.20% and 12.72% in planted area and a reduction in production by 48.23% and 15.17%, respectively while Benishangul-Gumuz Region showed an increase of 17.69% and 16.83% in planted area and production, respectively compared to the previous year.

SNNP Region cultivated 673.09 thousand hectares of land and is the third largest major crop growing region in the country, accounting for 8.40% of the total area planted at country level compared with 1997/98. This planted area increased by 22.03%.

The three remaining regions of Harari, Addis Ababa, and Dire Dawa experienced similar increase in planted area 23.87 %, 5.56%, and 16.04%, respectively compared with the 1997/98 Meher season crop. Yield was up by 14.02% in Harar and 42.24% in Dire Dawa and down by 22.59% in Addis Ababa compared with that of the previous year. Detailed estimates at regional as well as zonal levels are given in Tables 4 through 14.

Note

1. Some estimates in all reporting levels are excluded due to high coefficient of variations. Nevertheless, they are incorporated in the total estimates. Hence, the sum of the specific estimates may not be equal to the total estimates.
2. Users are also advised to use those estimates with 30-50% coefficient of variation (CV) with caution.
3. For those items in the tables where "-" appears, it implies that no data was obtained from the sample units from which an estimate could be made.

2. CROP DAMAGE ASSESSMENT

This section of the report deals with the summary of crop damage estimates and is the second of its type in the series of Area and Production Reports of the Annual Agricultural Sample Surveys.

Information on the type and extent of crop damage was collected subjectively by interviewing holders in the sampled agricultural households. The interview focused on each of the holders' fields sampled for crop cutting exercises on which 4m x 4m plot was demarcated and the crop in the plot was harvested. The yield obtained from these sampled plots is used to estimate production by type of crop at the desired reporting levels. Similarly, the type and extent of crop damage information was collected from sampled fields or crop cutting exercise plots and used to estimate the extent of crop damage by type at country level. As in the preceding issue of this report, CSA supplements this section on summary of crop damage to illustrate the reasons for this year's relatively lower yield of Meher season crops.

Hence, an attempt has been made to summarize crop damage estimates by type at country level for five selected cereal crops (namely, Teff, Wheat, Barley, Maize and Sorghum), all other crops combined and for the total of all crops. The objective of summarizing the crop damage estimates is mainly to illustrate the relatively low performance of this year's Meher season crop harvest by investigating yield estimates of damaged area by

type of damage and crops affected, and by comparing the effect of the damage on the estimated yield and/or production obtained from damaged area, with that of undamaged area of the same year as well as that of the last year's overall estimates.

The data in Table 3.1 show the impact of the crop damage on the 1998/99 (1991 E.C.) estimates of area, production and yield of all major crops. As indicated in the table, of the total area under all crops of this year Meher season harvest, it is reported that 26% of the total area under all crops was damaged due to "others" (flood, frost, animals, birds, hailstorm and other factors) while an additional 12% of the total area was damaged due to "too much rain". On the other hand, damage caused by "insects and pests infestation" has reduced all crop yield estimate from 11.46 qt/ha on undamaged crop area to 9.52 qt/ha (17%). Similarly, damage due to "too much rain", "shortage of rain" and "others" have reduced all crop yield estimate by 1.78 qt/ha (15%), 1.51 qt/ha (13%) and 1.35 qt/ha (12%), respectively. It should be noted that only 51% of the total area, which accounts for 54% of the total crop production of 1998/99 (1991 E.C.) was reported to be free from any type of crop damage. Hence, the overall crop damage on this year's production has slightly lowered all crop yield estimate by 0.37% when compared with that of 1997/98 (1990 E.C.) estimate.

This lower yield estimate of all crops was mainly attributed to crop damage caused by "too much rain", "shortage of rain", "insects and pest infestation" and other factors that prevailed in different parts of the country.

**Table 3.1 Estimates of Area, Production and Yield for All Crops
by Categories of Crop Damage for Private Peasant Holdings
1998/99 (1991 E.C.)**

CROP	REASON FOR CROP DAMAGE	AREA ('000 HA)	%	PRODUCTION ('000 QT)	%	YIELD (QT/HA)	% CHANGE FROM NO DAMAGE
ALL CROPS	NO DAMAGE	4,061.76	51.25	46,533.62	54.21	11.46	-
	INSECTS & PESTS	344.47	4.35	3,277.79	3.82	9.52	-16.93
	SHORTAGE OF RAIN	525.35	6.63	5,228.53	6.09	9.95	-13.18
	TOO MUCH RAIN	922.89	11.65	8,937.03	10.41	9.68	-15.53
	OTHERS	2,161.84	26.12	21,861.76	25.47	10.11	-11.78
	TOTAL	8,016.31	100.00	85,838.73	100.00	10.71	-

Furthermore, among the five major cereal crops Teff was hit by the unfavorable weather conditions that prevailed during the 1998/99 (1991 E.C.) Meher season. For instance, out of the total Teff area, 11% of it was damaged due to "too much rain", while the damage by "others" (flood, frost, animals, hailstorm, ... etc.) was 23%. Only 60% of the total area under Teff crop, however, was reported undamaged.

Consequently, the Teff yield estimate obtained from the damaged area due to "shortage of rain" has been reduced by more than a quarter (28%), while 12% reduction of Teff yield was observed in area damaged due to "insects

and pest infestation" compared to the undamaged area of Teff yield estimate (for detail see Table 3.2).

Despite the above mentioned damages caused by unfavorable weather conditions of the 1998/99 (1991 E.C.) crop year, the overall Teff yield estimate was up by 5% and the yield estimate of Teff from undamaged area which is 8.24 qt/ha was also up by 10% from the last year's estimate.

TABLE 3.2 Estimates of Area, Production Aand Yield for Teff by Categories of Crop Damage for Private Peasant Holdings 1998/99 (1991 E.C.)

CROP	REASON FOR CROP DAMAGE	AREA ('000 HA)	PRODUCTION		YIELD (QT/ HA)	% CHANGE FROM NO DAMAGE	
			('000 QT)	%			
TEFF	NO DAMAGE	1,246.81	59.89	10,273.01	62.55	8.24	-
	INSECTS & PESTS	53.6	2.57	389.58	2.37	7.27	-11.77

	OTHERS	494.71	23.31	3,615.00	22.01	7.31	-11.29
	TOTAL	2,091.34	100.00	16,422.85	100.00	7.85	-

Barley and Wheat were also affected by the unfavorable weather conditions that prevailed in 1998/99 (1991 E.C.) Meher season harvest. Data in Table 3.3 present the impact of crop damage on the area, production and yield of barley and wheat in 1998/99 (1991 E.C.). As shown in the table, out of the total area under barley and wheat, 21% and 18%, respectively are affected by "too much rain". As a result of this damage, the yield estimate is lowered

by 3% for barley and 13% for wheat when compared with that of yield estimates obtained from the undamaged area of these two cereal crops.

TABLE 3.3 Estimates of Area, Production and Yield for Barley and Wheat by Categories of Crop Damage for Private Peasant Holdings 1998/99 (1991 E.C.)

CROP	REASON FOR CROP DAMAGE	AREA ('000 HA)	PRODUCTION		YIELD (QT/HA)	% CHANGE FROM NO DAMAGE	
			%	('000 QT)			
BARLEY	NO DAMAGE	387.81	47.14	3,691.51	48.03	9.52	-

	OTHERS	262.82	26.24	2,874.62	25.81	10.94	-8.45
	TOTAL	987.07	100.00	11,137.82	100.00	11.28	-

Maize and Sorghum are the other two crops affected by the unfavourable weather conditions of 1998/99 (1991 E.C). As indicated in Table 3.4, 47% of the total area under Maize and 53% of the total area under Sorghum remained undamaged. Moreover, as a result of crop damage caused by "shortage of rain" 11% of the area under Maize and 12% of the area under sorghum were affected. Likewise the yield estimates of both crops were reduced by 7.49 qt/ha and 3.9 qt/ha (i.e. 36% and 29% reduction of Maize and Sorghum yield, respectively) compared to the undamaged area yield

estimates. The damage caused by "too much rain" has also reduced the Maize yield estimate by 15% and the Sorghum yield estimate by 19% from the undamaged yield estimates of both crops. The damage caused by "insects and pests infestation" has also reduced the yield estimates of Maize and Sorghum by 26% and 8%, respectively from the undamaged yield estimates.

In spite of this decrease the overall Maize and Sorghum yield estimates of this year have shown an increase of 6% and 13%, respectively over that of the previous year (for detail see Table 3.4).

TABLE 3.4 Estimates of Area, Production and Yield for **Maize and Sorghum** by categories of Crop Damage for Private Peasant Holdings 1998/99 (1991 E.C.)

	OTHERS	255.45	23.41	2,907.21	22.01	11.38	-18.48
	TOTAL	1,042.39	100.00	13,208.41	100.00	12.67	-

For other crops, the main damage is caused by "insects and pests infestation" and "others" which reduced the yield by 1.97 qt/ha and 1.71 qt/ha (i.e. 23% and 20%, respectively) from the undamaged yield estimate. The damage caused by "shortage of rain" and "too much rain" has also reduced the yield estimate by 1.36 qt/ha and 1.4 qt/ha (i.e. 16% and 17%, respectively) from the undamaged yield estimate of the same crops.

APPENDIX I

ESTIMATION PROCEDURES OF TOTAL, RATIO AND SAMPLING ERRORS

12

12

APPENDIX I

ESTIMATION PROCEDURES OF TOTAL RATIO AND SAMPLING ERRORS

The following formulas were used to estimate total area of land under specific crop, level of production and yield of specific crop in a stratum.

1. For estimating total area of land under specific crop:

$$\hat{A}_h = \sum_{i=1}^{n_h} W_{hi} a_{hi}$$

in which

$$W_{hi} = \frac{N_h M_{hi}}{n_h N_{hi} m_{hi}}$$

is the weight.

Where:

h represents the stratum.

n_h is the total number of EAs selected in the h^{th} stratum.

N_h is the measure of size of the h^{th} stratum as obtained from the sampling frame.

N_{hi} is the measure of size of the i^{th} sample EA in the h^{th} stratum obtained from the sampling frame.

M_{hi} is the total number of agricultural households of the i^{th} sample EA in the h^{th} stratum obtained from household listing of the survey.

m_{hi} is number of sample agricultural households of the i^{th} sample EA in the h^{th} stratum.

a_{hi} is the sample total of values of area in the i^{th} EA in the h^{th} stratum under a specific crop.

\hat{A}_h is estimate of total area under specific crop in the h^{th} stratum.

2. For estimating level of production:

$$\hat{P}_h = \sum_{i=1}^{n_h} W_{hi} P_{hi}$$

in which

$$P_{hi} = \bar{a}_{hi} \times \bar{Y}_{hi}$$

where:

$$\bar{a}_{hi} = \frac{a_{hi}}{m_{hi}}$$

$$\bar{Y}_{hi} = \frac{Y_{hi}}{16C_{hi}}$$

Note: W_{hi} is as defined above.

Where: Y_{hi} is sampled total of yield of a specific crop from 16 m^2 area of land for crop-cutting of crop in the i^{th} EA in the h^{th} stratum.

C_{hi} is number of crop-cutting of a specific crop in the i^{th} EA in the h^{th} stratum.

\bar{a}_{hi} is sampled average area per agricultural household under specific crop in the i^{th} EA in the h^{th} stratum.

\bar{Y}_{hi} is average yield per square meter of a specific crop in the i^{th} EA in the h^{th} stratum.

\hat{P}_{hi} is estimate of production quantity per household of a specific crop in the i^{th} EA in the h^{th} stratum.

\hat{P}_h is estimate of total production quantity of a specific crop in the h^{th} stratum.

3. Estimate of yield of a specific crop is given by:

$$\hat{Y}_h = \frac{\hat{P}_h}{\hat{A}_h}$$

4. Sampling variance of Estimates:

Sampling variance of estimate of stratum total of area, production and yield for a specific crop are estimated by the following formulas, respectively.

$$Var(\hat{A}_h) = \frac{n_h}{n_h - 1} \left[\sum_{i=1}^{n_h} \hat{A}_{hi}^2 - \frac{\hat{A}_h^2}{n_h} \right]$$

$$Var(\hat{P}_h) = \frac{n_h}{n_h - 1} \left[\sum_{i=1}^{n_h} \hat{P}_{hi}^2 - \frac{\hat{P}_h^2}{n_h} \right]$$

$$Var(\hat{Y}_h) = [Var(\hat{P}_h) + \hat{Y}_h^2 Var(\hat{A}_h) - 2\hat{Y}_h Cov(\hat{P}_h, \hat{A}_h)]$$

Where

$$Cov(\hat{P}_h, \hat{A}_h) = \frac{n_h}{n_h - 1} \left[\sum_{i=1}^{n_h} \left(\hat{A}_{hi} - \frac{\hat{A}_h}{n_h} \right) \left(\hat{P}_{hi} - \frac{\hat{P}_h}{n_h} \right) \right]$$

In estimating the sampling variance by the above formula, selection of EAs within a stratum is assumed to be with replacement. By so doing the variance estimate may be slightly over estimated but it greatly simplify the estimation procedure. Furthermore the finite population correction (fpc) is ignored in the formula. This is due to the fact that its effect is negligible.

5. Coefficient of Variation (CV) of estimates:

Coefficient of Variation (CV) in percentage of estimate of stratum total of area, production and yield for a specific crop are given respectively by:

$$CV(\hat{A}_h) = \sqrt{\frac{Var(\hat{A}_h)}{\hat{A}_h}} \times 100$$

$$CV(\hat{P}_h) = \sqrt{\frac{Var(\hat{P}_h)}{\hat{P}_h}} \times 100$$

$$CV(\hat{Y}_h) = \sqrt{\frac{Var(\hat{Y}_h)}{\hat{Y}_h}} \times 100$$

BE COVERED AND ACTUALLY COVERED

-NUMBER OF PARCELS AND FIELDS MEASURED

-NUMBER OF CROP CUTTINGS CONDUCTED

三、研究結論

本研究以「臺灣地區」為研究對象，探討了「臺灣地區」的社會文化背景。研究發現，臺灣地區的社會文化背景具有「多元性」與「包容性」的特點。在多元性方面，臺灣地區擁有豐富的文化底蘊，包括閩南、客家、外省、原住民等多元族群的融合。在包容性方面，臺灣地區社會展現了對不同文化、語言和習俗的尊重與包容，營造了和諧共融的社會氛圍。

CORRIGENDUM

1. Table of Contents

Estimates of Area Under Temporary Crops
should be read as Estimates of Area under All Crops

2. List of Tables

The group of Tables in AMHARA , i.e. South Wolo, Oromia and Shewa Zone
should be read as South Wolo, Oromia and North Shewa Zone

3. List of Tables

Table 5.12 under Table 5 (for Addis Ababa) is in Page 94;
it should be in Page 95
